

Warrego Summer Grass *Paspilidium jubiflorum*

We are pleased to introduce this important native colonizing grass to mining companies and major roadside landscaping projects. Warrego summer grass is an excellent stock feed producing a good seed litter for natural ongoing revegetation. The seed line was derived from western NSW and is virtually pure with a germ of 94% making it an excellent choice for mechanical sowing or hydraseeding.

- Perennial tropical grass
- High protein levels
- Hays off but remains palatable to stock
- Found on most soil types
- Excellent for pasture cropping
- Ideal for revegetation projects
